

The Norman Seine LAG

A rural development that drives innovation and social links, resilient in the face of climate change

Action sheets

-  Experiment with nature-based solutions to limit climate change and its consequences
-  Promote the territory's resources in short channels and in sobriety
-  Develop a cultural and touristic offer promoting the assets of the territory
-  Develop entrepreneurship and experiment with new economic models
-  Strengthening the heart of villages through an offer of services adapted to different life paths
-  Living, moving and working on our territory

Structuring the eco-materials sector

- *In a context of climate change, we started to turn to virtuous ways of building and being more energy efficient*
- An eco-material is a material which has the technical qualities required to be considered as a construction material, but which also has environmental or socio-environmental qualities. It is a material that is part of a global approach to sustainable development over its entire life cycle.
